1. The Unifying Principle

The boundaries of a problem dictate its solutions. A narrow frame yields narrow solutions.

Two Dimensions of Insight

The Macro Lens (External)

Re-engineering business problems and external systems. Focuses on how the problem is defined and framed at the organizational level.

The Micro Prism (Internal)

Using language to transform limiting beliefs and perceptions. Focuses on the internal linguistic structures that shape our reality.

2. Part I — Problem Reframing [MACRO]

Wedell-Wedellsborg Methodology

How we frame a situation determines the solutions available to us. Problem Reframing is the systemic discipline of deliberately changing the problem definition to unlock better, faster, and cheaper solutions.

2.1 Classic Case Study: The Slow Elevator

THE INITIAL FRAME	THE REFRAME
Problem: "The lift is too slow." Solution: Upgrade the motor, install new algorithms. <i>(Highly expensive, entirely technical)</i>	Problem: "The wait is annoying." Solution: Install mirrors in the lobby. <i>(Extremely cheap, entirely psychological)</i>

The Insight: The actual problem was not mechanical speed — it was the human perception of time.

2.2 The Rapid Reframing Process

1. FRAME Establish the baseline	2. REFRAME Break the baseline	3. MOVE FORWARD Test reality
Ask "What problem are we really solving?" Identify the critical stakeholders involved. Formally write down the initial problem definition.	Brainstorm alternative views. Actively challenge the assumed "true" cause. Deploy lateral strategies (like studying Bright Spots).	Deploy prototype solutions in the real world. Verify the accuracy of the new diagnosis through immediate action.

2.3 Five Strategic Lenses to Break a Rigid Frame

Look Outside the Frame — Identify missing factors.

Example: Analyzing competitor market moves rather than obsessing over internal churn metrics.

Rethink the Goal — Is there a better target?

Example: Shifting the team objective from 'increase raw sales volume' to 'maximize customer lifetime value'.

Study Bright Spots — Find the positive exceptions.

Example: Instead of fixing failing branches, reverse-engineer the success of your one high-performing team.

Look in the Mirror — Assess personal contribution.

Example: Realizing management's own complex approval processes are the true cause of client delivery delays.

Stakeholder Perspectives — Anchor and adjust based on how others view the system.

Example: See the problem through the eyes of each stakeholder to find hidden dimensions.

2.4 Diagnostic Rules for Evaluating Breakthroughs

Before committing resources to a new frame, run it through the diagnostic test:

1. Look for Surprising Insights

Does the reframe fundamentally challenge the established status quo? If it feels entirely comfortable, it is not a breakthrough.

2. Seek Simple Explanations

Does it cut through accumulated complexity? The best reframes replace a tangled web of symptoms with a single, elegant root cause.

3. Prioritize Breakthrough Potential

Does this new perspective unlock an entirely new category of solutions that were previously invisible?

3. Part II — Sleight of Mouth [MICRO]

Robert Dilts — NLP Language Strategies

The Pivot: You cannot solve a reframed external problem with a team trapped by limiting internal beliefs. Language itself acts as the structural code that creates — and dismantles — our reality.

3.1 NLP Foundations: The Map is Not the Territory

Internal Models	Layers of Experience	Linguistics
Our perception (The Map) is fundamentally distinct from objective reality (The Territory). Language modifies the map, not the world.	Primary Experience: what actually occurs. Secondary Experience: the subjective meaning and emotional weight we assign.	Surface Structure: the actual words spoken out loud. Deep Structure: the subconscious, hidden meaning and assumptions driving the words.

3.2 Primary Thinking Frames

Outcome Frame — Focus on Goals

Shifting attention away from the problem and toward the desired state.

Shift: "I want to stop failing at this task" → "I am working to master this skill."

Feedback Frame — Errors as Data

Stripping emotional failure from outcomes, treating them purely as informational inputs.

Shift: "The client rejected the pitch, we failed." → "This rejection is data proving the market requires a different feature set."

As If Frame — Acting on Potential

Bypassing immediate constraints by simulating a future state to unlock lateral thinking.

Shift: "We can't afford to build this." → "If we already had an unlimited budget, what exact architecture would we design?"

3.3 Reframing Methods — Core Mechanics of Shifting Meaning

Context Reframing (Changing the Situation)

Recognizing that every behavior is useful in some context. A trait that is a liability here might be an asset elsewhere.

Example: "Stubbornness" on a collaborative team becomes highly valuable "Tenacity" during a crisis.

Content Reframing (Changing the Meaning)

The situation remains exactly the same, but its implication shifts based on what we choose to highlight.

Example: A sudden system crash is not a "disaster"; it is a "live stress-test revealing hidden vulnerabilities before launch."

Outcome Reframing (Pivoting Focus)

Changing the metric of success entirely to render the current problem irrelevant.

Example: Stop measuring support tickets; start measuring customer self-sufficiency rate.

4. Belief Intervention Patterns

Base Limiting Belief: "Our product is too expensive, so we cannot sell it."

Intervention Pattern	Mechanism	Empowering Reframe
Positive Intent	Identify the hidden benefit behind the limiting behavior or objection.	The intent behind our pricing structure is ensuring uncompromising quality and long-term reliability for our users.
Redefinition	Assign new, structurally different labels to the exact same experience.	We are not selling an "expensive product"; we are offering a "premium, risk-free investment".
Consequence	Highlight the negative downstream effects of holding the limiting belief.	If we lower the price to just make sales, we immediately lose the margin required to provide elite customer support.
Counter-example	Find the absolute exception that breaks the universal rule.	Apple and Porsche hold the highest price points in their categories and dominate market share.
Hierarchy of Criteria	Elevate the conversation to prioritize a higher-order value.	Isn't delivering undeniable, long-term ROI more important to our clients than having the cheapest upfront cost?

5. Techniques for Deep Change

Museum of Personal History (Contextualizing the Past)

Recognizing that past beliefs were valid for the environment they were built in. "We used to believe X, and that served us then. Now our environment demands Y." This technique validates old beliefs while creating space for new ones.

Natural Cycle of Change (Managing the Transition)

Actively guiding a stakeholder through the necessary emotional stages: moving from comfortable certainty, through productive doubt, exploration, and finally integrating a new belief. Change is a process, not an event.

Meta-mirror (Systemic Integration)

Forcing individuals to physically or conceptually step outside themselves to view the system from multiple, conflicting perspectives simultaneously. Creates systemic insight by integrating all viewpoints at once.

6. Synthesis: The Complete Reframing Arsenal

Dimension	Problem Reframing (Macro)	Sleight of Mouth (Micro)
Target	External systems, workflows, and business definitions.	Internal linguistics, limiting assumptions, and team psychology.
Toolset	Bright spots, stakeholder perspectives, structural analysis.	Thinking frames, meaning-shifting, belief intervention matrices.
Goal	Engineering better strategic solutions and avoiding 'wrong problem' traps.	Cultivating empowering mindsets capable of executing new strategies.

The Master Insight: Breakthrough transformation demands both frameworks. Changing the system requires changing the language used to describe it.

7. The Ultimate Competitive Advantage

The ultimate advantage in leadership and strategy is not possessing all the right answers, but maintaining the psychological and linguistic flexibility to instantly change the frame.

The Mandate

The next time you hit a wall, do not default to pushing harder. Step back and ask:

- Am I looking at the **right problem**?
- Am I using the **right language** to describe it?
